

CPU-GPU LESGO result comparison: single NREL 5 MW turbine, no turbulence model

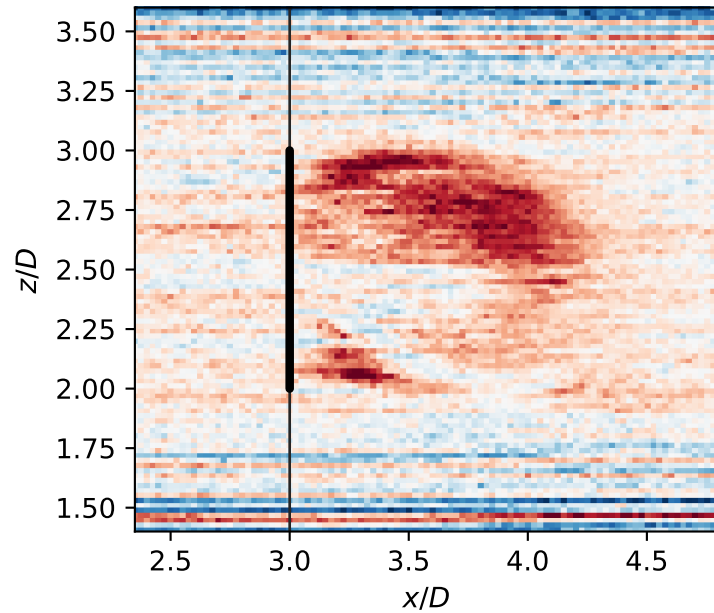

(a) CPU backend: axial velocity u/U_∞

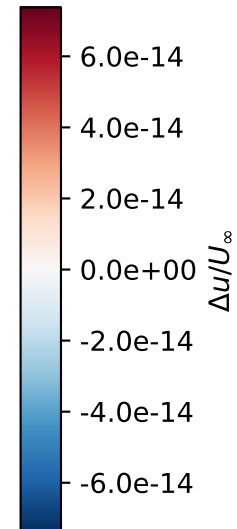

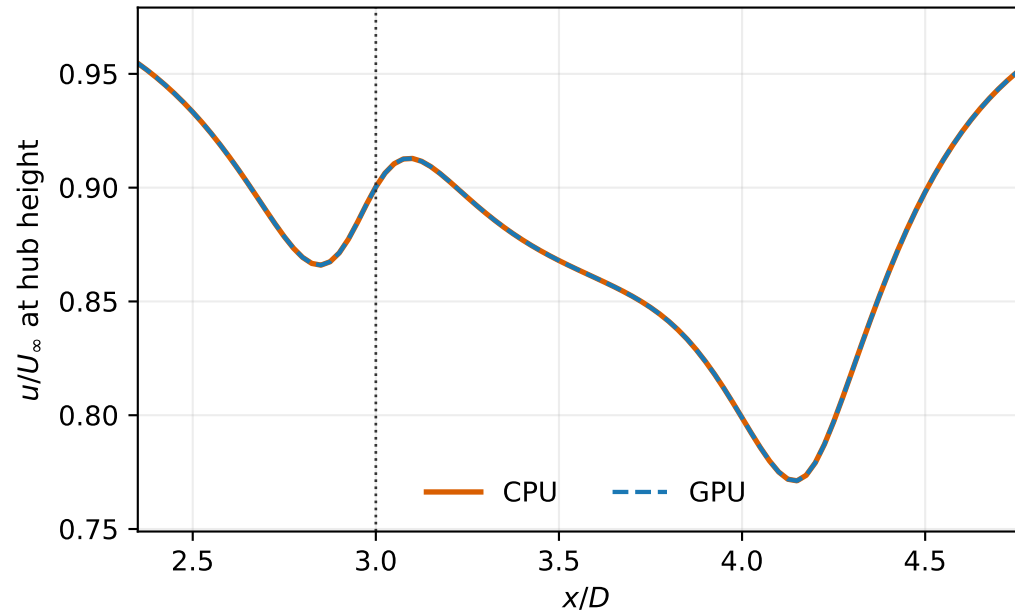

(b) GPU backend: axial velocity u/U_∞

(c) GPU minus CPU (roundoff scale)

(d) Hub-height centerline

Cold start, 1,000 fixed steps, $t=15.4737$ s; $480 \times 384 \times 240$ grid; vertical rotor-center plane $y/D=4.0$. Identical color scale in (a) - (b).
